**ABSTRACT:** A checklist of species belonging to the families Cortinariaceae and Entolomataceae was made for Argentina. The list includes all species published until the year 2012. Nineteen genera and 444 species were recorded, 370 species from the family Cortinariaceae and 74 from Entolomataceae. All of them are distributed in 19 genera, the most important being *Cortinarius* (240 species), *Galerina* (51), *Entoloma* (39) and *Inocybe* (40). With the exception of *Hebeloma* (13 species), *Gymnopilus* (12) and *Clitopilus* (11), the rest of the 13 genera have less than 10 species each. *Galeropsis*, *Locellina*, *Nolanea* and *Pseudogymnopilus* have only one species recorded so far.

## INTRODUCTION

Argentina is located in southern South America, between 21° and 55° S and 53° and 73° W, covering 3.7 million of km<sup>2</sup>. Due to the large size of the country, Argentina has a vast variety of climates; from humid tropical forests (such as the Yungas and Paranaense forests), xerophytic forests (Chaco, Espinal), grasslands (Pampa), deserts (Puna, Patagonian steppe, Monte), to cold and humid habitats (Patagonian Andean forest) (Burkart *et al.* 1999, Brown *et al.* 2006, Niveiro and Albertó 2012a). Cabrera (1994) divides Argentina into 11 phytogeographic provinces, which belong to 4 Domains and 2 Regions. An extended list of vegetation types presented in each phytogeographic province can also be consulted in Cabrera's book (*op. cit.*).

In previous papers, partial checklists of the Argentinean Agaricales were presented for the families Amanitaceae, Pluteaceae, and Hygrophoraceae (Niveiro and Albertó 2012a); Coprinaceae and Strophariaceae (Niveiro and Albertó 2012b); Bolbitaceae and Crepidotaceae (Niveiro and Albertó 2012c); Tricholomataceae (Niveiro and Albertó 2012d); Agaricaceae (Niveiro and Albertó 2013a); and Paxillaceae, Gomphidiaceae, Boletaceae, and Russulaceae (Niveiro and Albertó 2013b). The list of species for Cortinariaceae and Entolomataceae of Argentina is presented in this work. The Cortinariaceae was studied by Moser and Horak (1975), Horak (1980), Moser (2001), Singer and Digilio (1952), Singer (1954, 1969), and Spegazzini (1988). The Entolomataceae was mainly studied by Singer and Digilio (1952), Singer (1969),

and Horak (1976, 1978, 1980, 1982, 1983). The purpose of this study is to establish a baseline of knowledge about the diversity of species described for the families Cortinariaceae and Entolomataceae in Argentina, as a base for future studies of mushroom diversity.

## MATERIALS AND METHODS

### *Nomenclature and classification systems*

This checklist was based on all publications recorded for Argentina until 2012. Nomenclature and classification systems followed Singer (1986) for families, and Kirk *et al.* (2008) and Index Fungorum (2013) for genera and species. There have been important rearrangements in the Cortinariaceae since Singer (1986). These taxonomic changes are summarized in Table 1. List of synonyms of species was drastically reduced and only the basionym and the names recorded for Argentina of each species were included. Index Fungorum was consulted for current names of species and synonyms.

For journal abbreviations, the Botanico Periodico Huntianum (2013) web site was used. For authors's abbreviations, the International Plant Names Index (IPNI) (2012) and Authors of Fungal Names (2013) were used. References cited for each species were ordered firstly by author in alphabetical order and secondly by year of publication.

We found genera that are currently not considered valid (Kirk *et al.* 2008), and whose species were transferred to another genus (for example *Astrosporina*, at present

**TABLE 1.** Position of the Cortinariaceae genera treated in this paper according to different classification systems (Cort.: Cortinariaceae, Hym.: Hymenogastraceae, Inocyb.: Inocybaceae, Stroph.: Strophariaceae, n/d: no data).

	Singer (1986)	Matheny <i>et al.</i> (2006)	Kirk <i>et al.</i> (2008)	Mycobank (2013)
<i>Cortinarius</i>	Cort.	Cort. S. str.	Cort.	Cort.
<i>Flammulaster</i>	n/d	Tubariae	Inocyb.	Inocyb.
<i>Galerina</i>	Cort.	Hym.	Stroph.	Stroph.
<i>Gymnopilus</i>	Cort.	Gymnopileae	Stroph.	Stroph.
<i>Hebeloma</i>	Cort.	Hym.	Stroph.	Stroph.
<i>Inocybe</i>	Cort.	Inocyb.	Inocyb.	Inocyb.

*Inocybe*). However, not all the species of those genera have been transferred to the current genus. As type materials were not studied, we cited them as they were originally published. The valid genus according to Kirk *et al.* (2008) is given between brackets followed by the symbol =; for example: *Astrosporina* J. Schröt. [= *Inocybe* (Fr.) Fr.].

Sometimes Spegazzini used symbols or letters when he referred to subspecific taxonomic ranks (for example: *Agaricus* (*Hebeloma*) *crustuliniformis* Fr. *\*austrro-americanus* Speg.). In those cases we used the same nomenclature that Spegazzini originally published, although according to art. 37.4 of ICNB (Mcneill *et al.* 2012) it is considered to be a variety.

Remarks were only added in those taxa where we found a conflict, such as: species not validly published (NVP), the holotype is missing (MH), doubtful name, synonyms, unpublished transfer of a species to a different genus, or when the distribution of the species was not completely clear.

Books were cited by the year in which they were published, and not the year printed in the publication. This is the case, for example, of “Pródromo de la flora Agaricina” which was cited as Singer and Digilio (1952). In this case, two years are provided for species citation in the “literature cited” section, the real year of publication between parentheses and the year printed in the book between brackets.

Distribution

Species distribution was cited according to the Province where it was collected using abbreviations (Table 2). A map with the political division of Argentina and the abbreviations for each state can be found in Niveiro and Albertó (2012a).

It should be taken into account that although many species were recorded in the Provinces of the Argentine Patagonia (Neuquén, Rio Negro, Chubut, Santa Cruz, Tierra del Fuego), most of them were found in the Patagonian Andes Forest, which is located in a narrow strip to the west of the southern Provinces.

RESULTS

A checklist based on an exhaustive bibliographic revision of species belonging to the families *Cortinariaceae*

and *Entolomataceae* from Argentina was done. From Spegazzini (1880) until 2012, 444 species been recorded so far in Argentina for the two families. All of them are distributed in 21 genera, the most important being *Cortinarius* (235 species), *Galerina* (51), *Entoloma* (39) and *Inocybe* (40). With the exception of *Hebeloma* (13 species), *Gymnopilus* (12) and *Clitopilus* (11) the rest of the 13 genera, have less than 10 species each. *Galeropsis*, *Locellina*, *Nolanea* and *Pseudogymnopilus* have only one species each, recorded so far.

CORTINARIACEAE R. Heim ex Pouzar

Astrosporina J. Schröt. [= Inocybe (Fr.) Fr.]

## DISCUSSION AND CONCLUSION

This work completes the current knowledge of recorded species of Agaricales from Argentina. We believed that it is an important baseline of knowledge that will have to be perfected and polished. There are still some taxonomic difficulties to be considered and that a specialist in each of the genera above-mentioned will have to deal with; for example, transferring some species to another genus, moving some varieties to specific level, evaluating the state of conservation of the collections and verify the correct taxonomic determination, which escape the goals of the work presented herein.

The number of species recorded in this work was 240 from the family *Cortinariaceae* and 74 from

*Entolomataceae*. The former is the second largest family of Agaricales recorded in Argentina. The first one being *Tricholomataceae* with 709 species (Niveiro and Albertó 2012d) and the third one *Agaricaceae* with 171 species (Niveiro and Albertó 2013a).

The genus *Cortinarius*, with 239 species described for Argentina, is the genus with the largest number of species in the country which is not surprising considering that this genus is also the most diverse of the Agaricales worldwide with about 2000 species (Kirk *et al.* 2008). Despite its high diversity, most of the species were only found in the Andinopatagonic forests (Moser and Horak 1975) having few species distributed in the montane forests of Northwestern part of Argentina (Moser 2001). At present,

*Cortinarius* includes other traditional genera such as *Cuphocybe*, *Rozites*, *Rapacea* and the sequestrate genera *Thaxterogaster*, *Protoglossum*, *Quadrispora* and *Hymenogaster* p.p. (Niskanen 2008); however, in this paper we have not included the latter since these genera were considered *Gasteromycetes sensu* Singer (1986), although there are several species of sequestrate agarics that have been described for Argentina (Horak 1980).

**FIGURE 7.** *Pseudogymnopilus pampeanus* (Speg.) Raithelh. Specimens growing under *Pinus* sp. Scale bar = 10 cm.

**ACKNOWLEDGMENTS:** The authors wish to thank authorities of PROPLAME-PRHIDEB (CONICET) for allowing us to work in the mycology library of the Facultad de Ciencias Exactas y Naturales, University of Buenos Aires. We also want to express our gratitude to Laura del Busto, who helped us with books and journals searches. This research was made possible by the support of the Argentine Nat'l Research Council (CONICET).
